

**PARIS  
MASH  
MEETING**

**10<sup>th</sup> edition**

**September 5 & 6 2024  
Institut Pasteur, Paris**

# **Best practices in disease monitoring of MASH**

**Pr Jérôme Boursier**

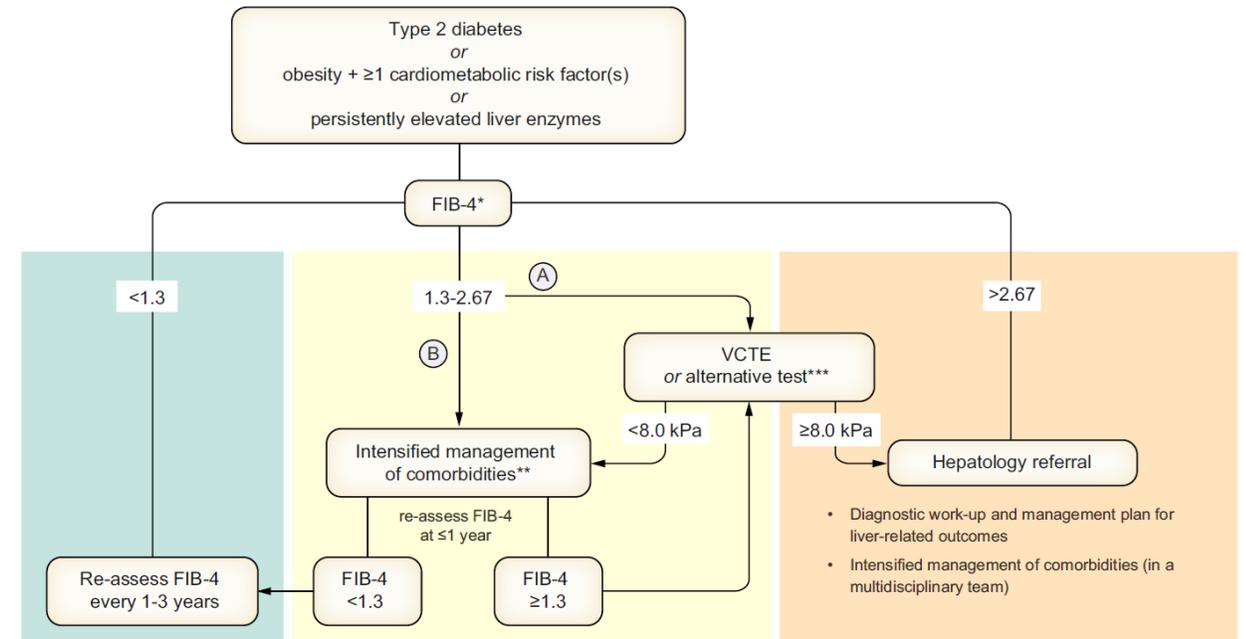

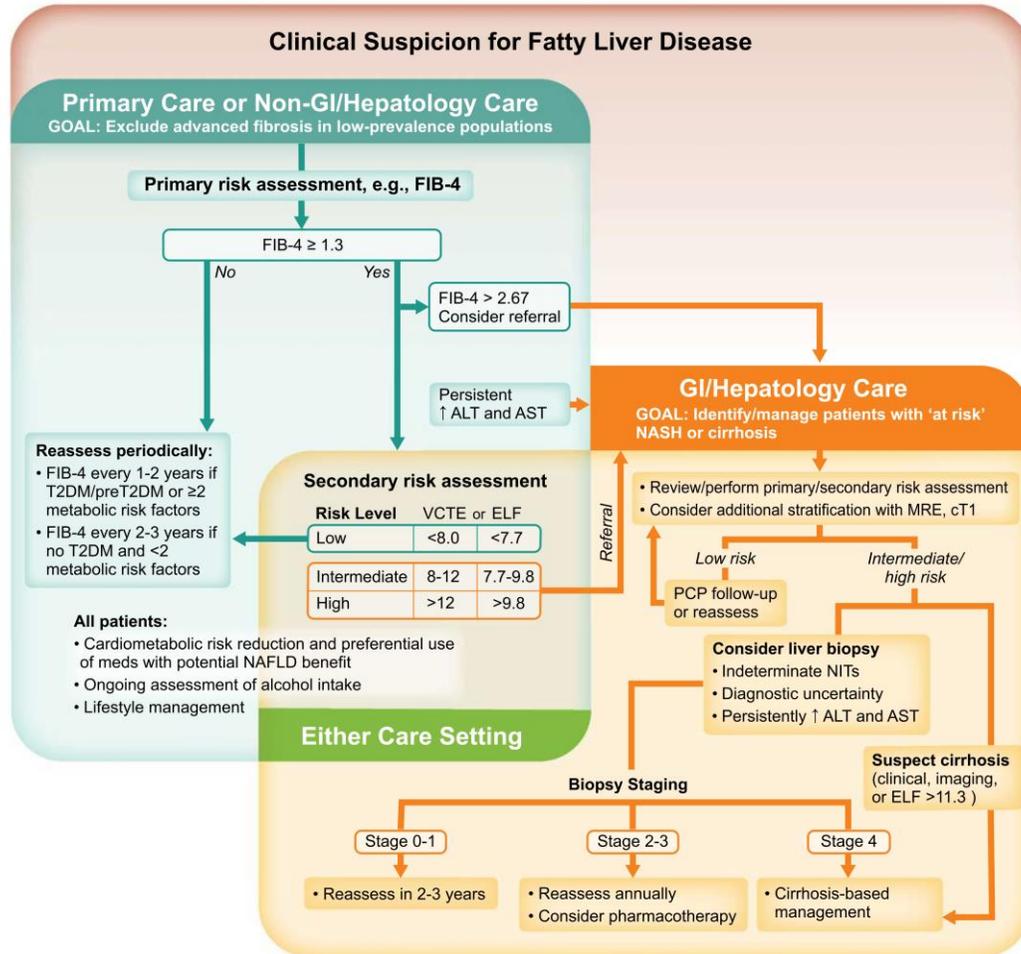

Université d'Angers et Centre Hospitalier Universitaire d'Angers

# Disclosures

- **Consultant:** Echosens, Intercept, Inventiva, Siemens
- **Board:** BMS, Intercept, Pfizer, MSD, Novo Nordisk
- **Speaker:** Abbvie, Gilead, Intercept, Siemens, Novo Nordisk
- **Funds for scientific research:** Diafir, Echosens, Gilead, Intercept, Inventiva, Ipsen, Siemens

# 1. Monitoring the disease evolution

# Recommendations for the non-invasive assessment of MASLD severity

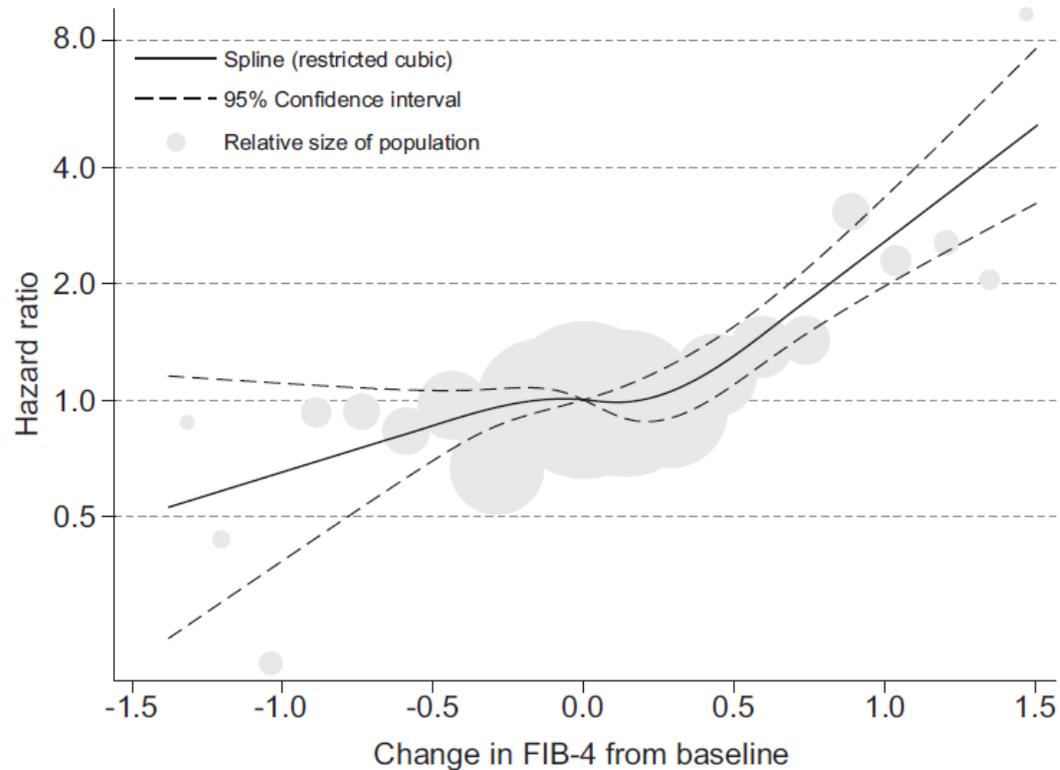

# Monitoring disease progression with FIB4

## AMORIS cohort (Sweden)

40,729 subject with repeated FIB4

Median time between FIB4 : 2.4 years [IQR: 1.3-3.9]

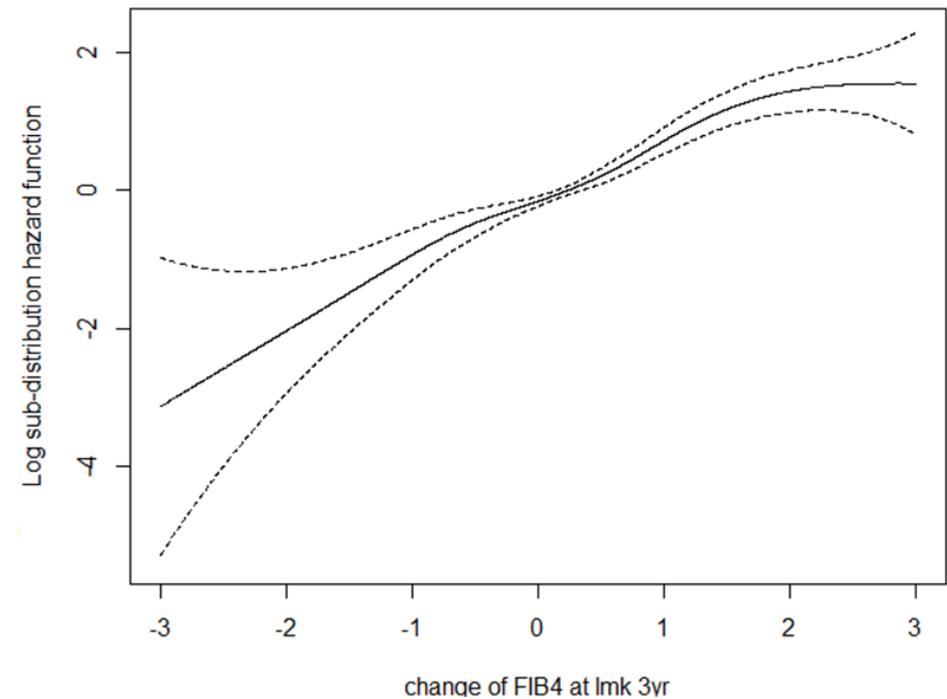

581 liver-related events during the median 16.2 years FU

## National VA Corporate Data Warehouse (USA)

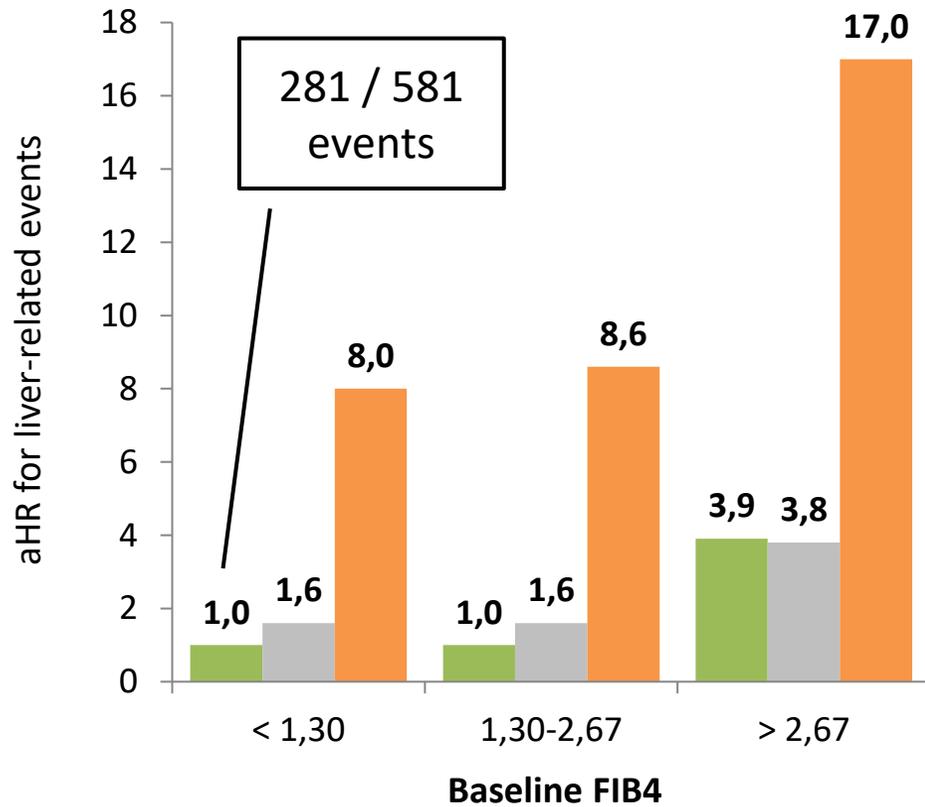

202,319 subject with repeated FIB4 at 3-year landmark time

2,161 cirrhosis or HCC events during the mean 8.2 years FU

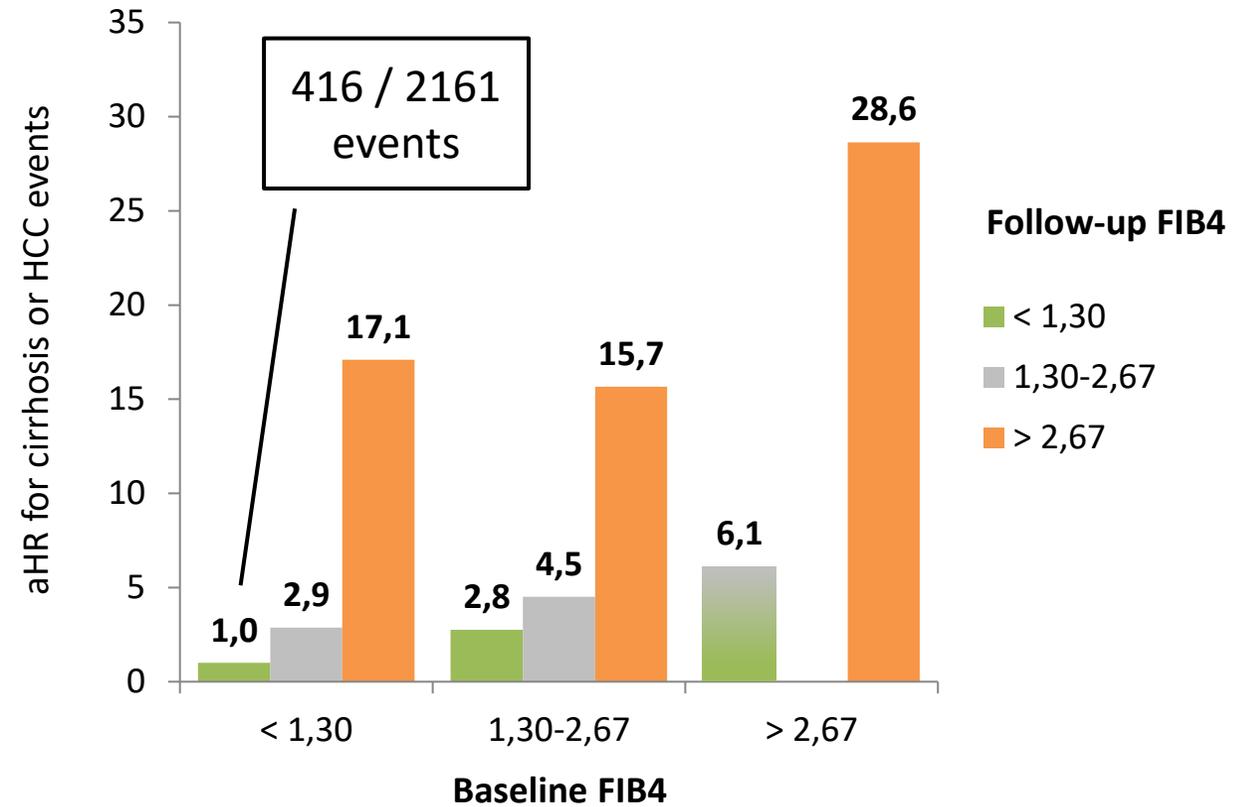

# Monitoring disease progression with FIB4

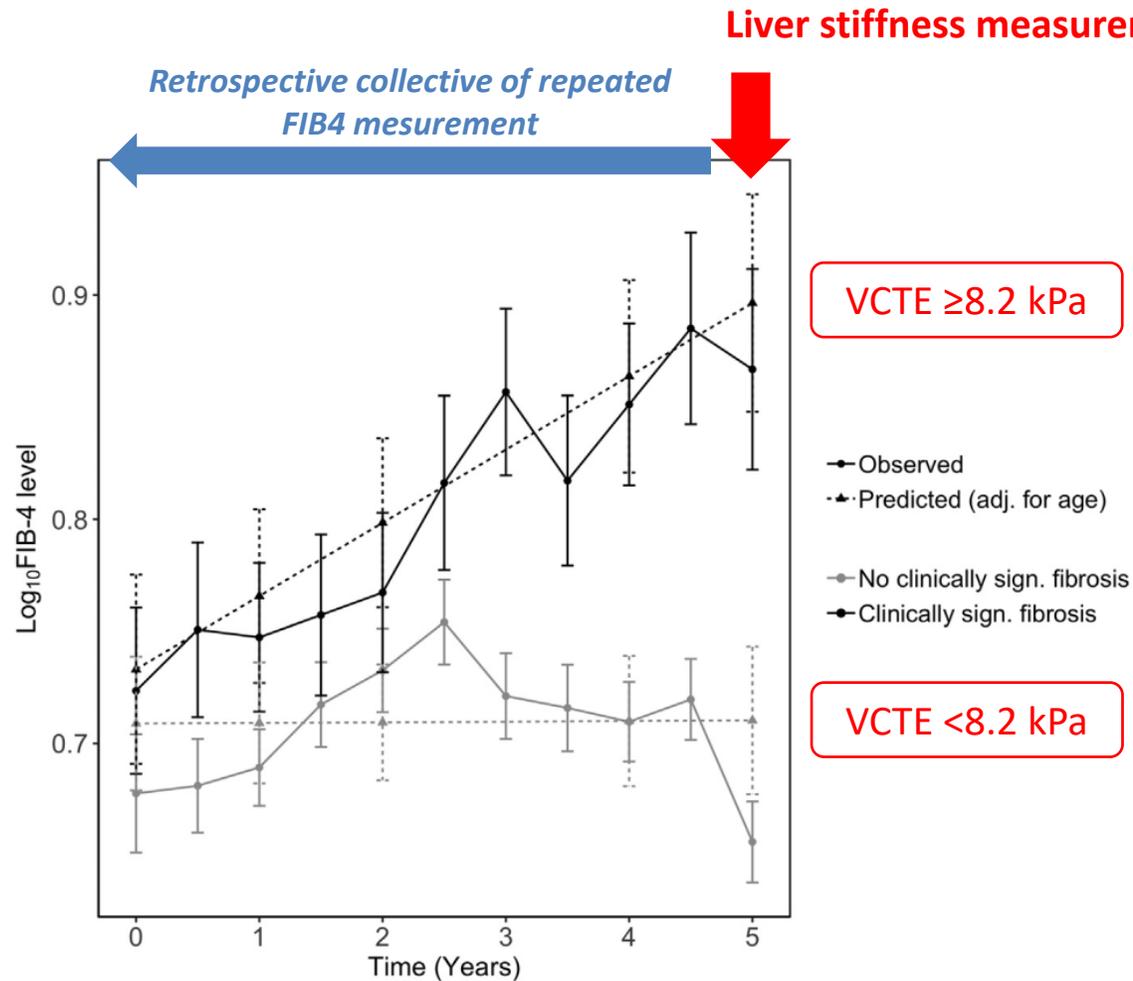

AMORIS cohort (Sweden)

National VA Corporate Data Warehouse (USA)

# Monitoring disease progression with FIB4

Retrospective  
monocentric study

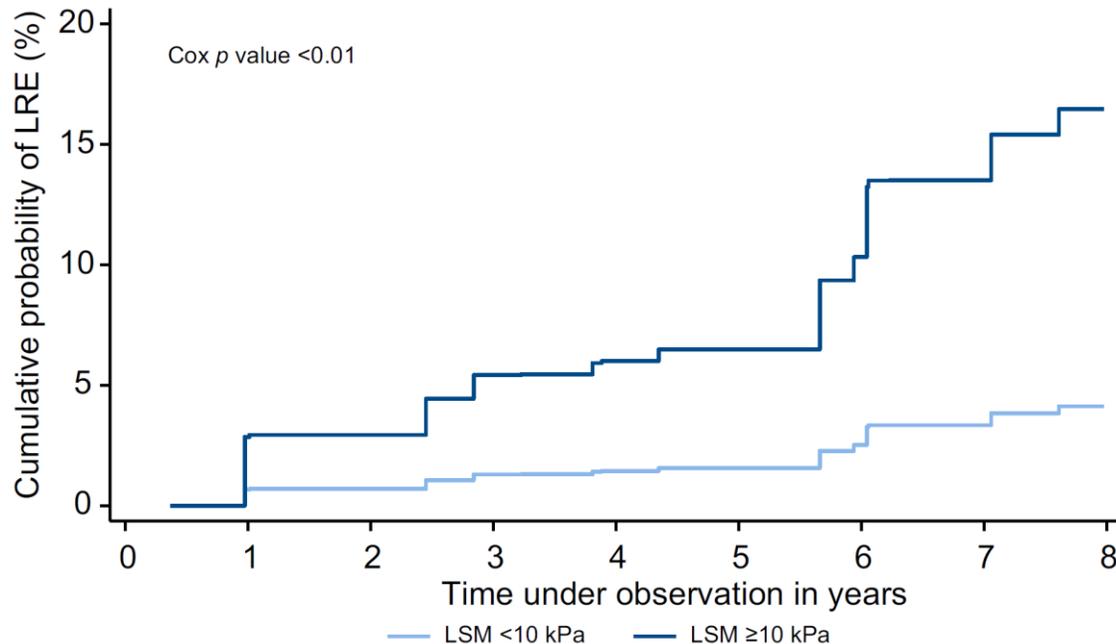

252 patients  
with NAFLD

No clin. sign. fibrosis	77	105	122	124	123	125	127	133	142	149	158
Clin. sign. fibrosis	54	55	60	62	60	58	62	64	70	69	72

# Monitoring disease progression with elastography

## NASH CRN cohort (USA)

1,403 patients with biopsy-proven MASLD and repeated VCTE  
89 liver-related events during the median 4.4 years FU

**Progressors**  
(from <10 kPa to ≥10 kPa)  
**16% LRE**

**aHR: 4.0**

**Non-progressors**  
(from <10 kPa to <10 kPa)  
**4% LRE**

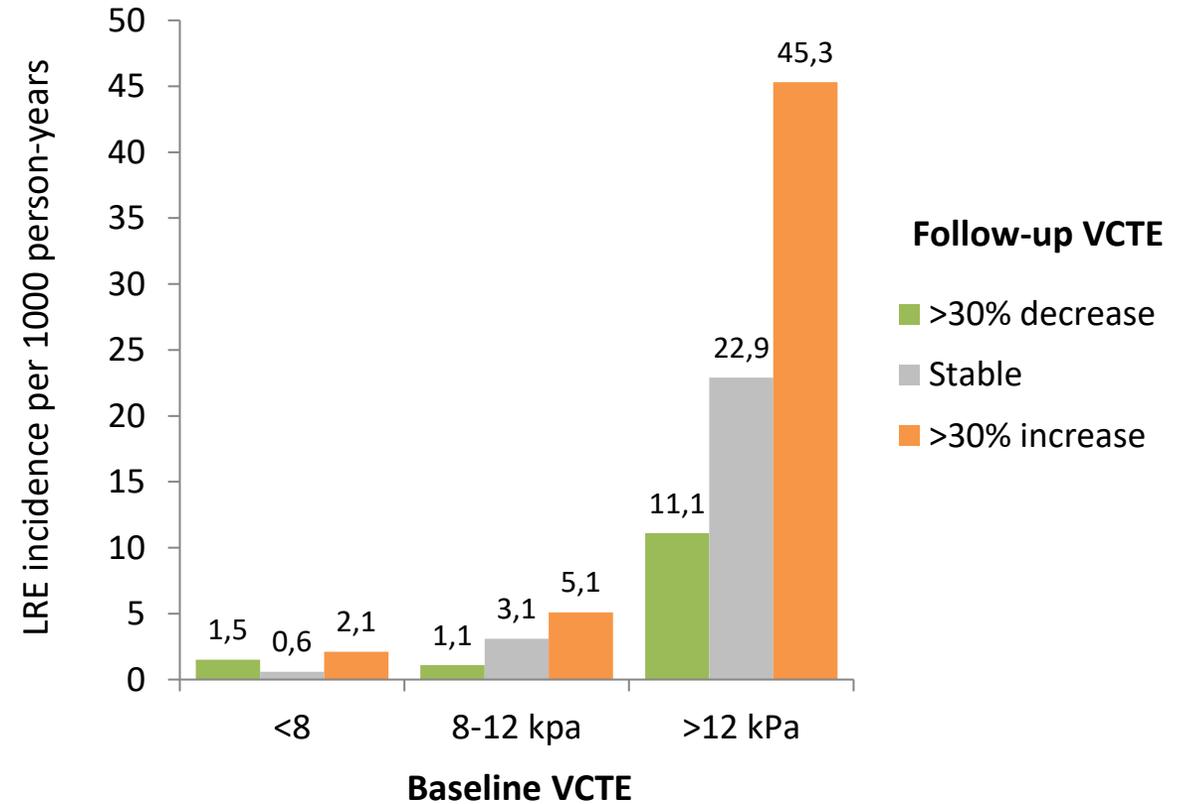

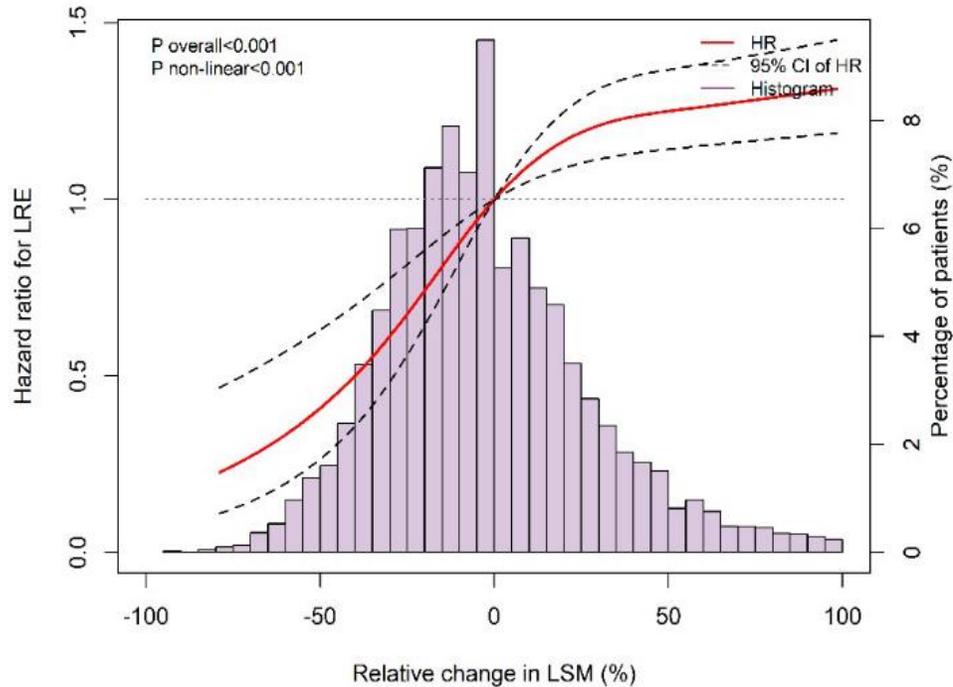

**In patients with baseline LSM ≥ 8 kPa**

LSM ≥ 30% kPa  
aHR for LRE  
**1.90 (1.16-3.12)**

# Monitoring disease progression with elastography

## Multicentric international cohort

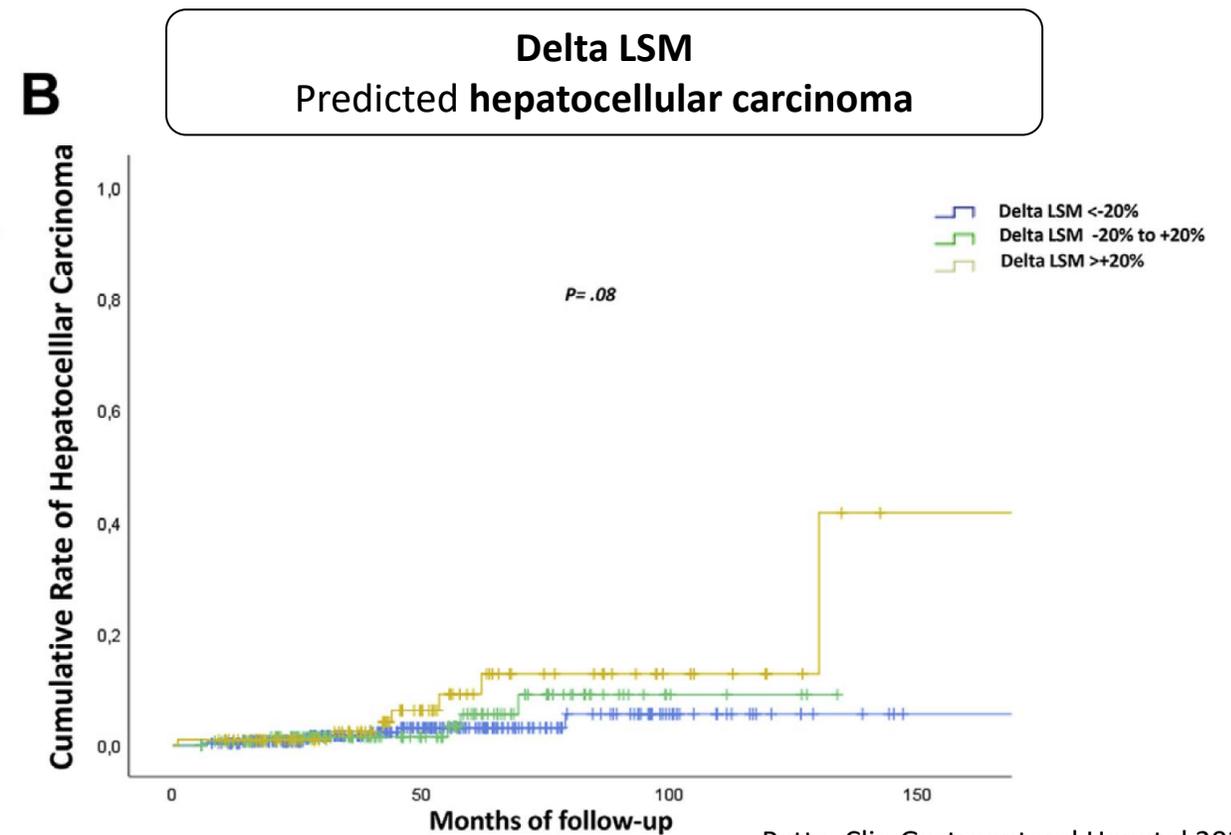

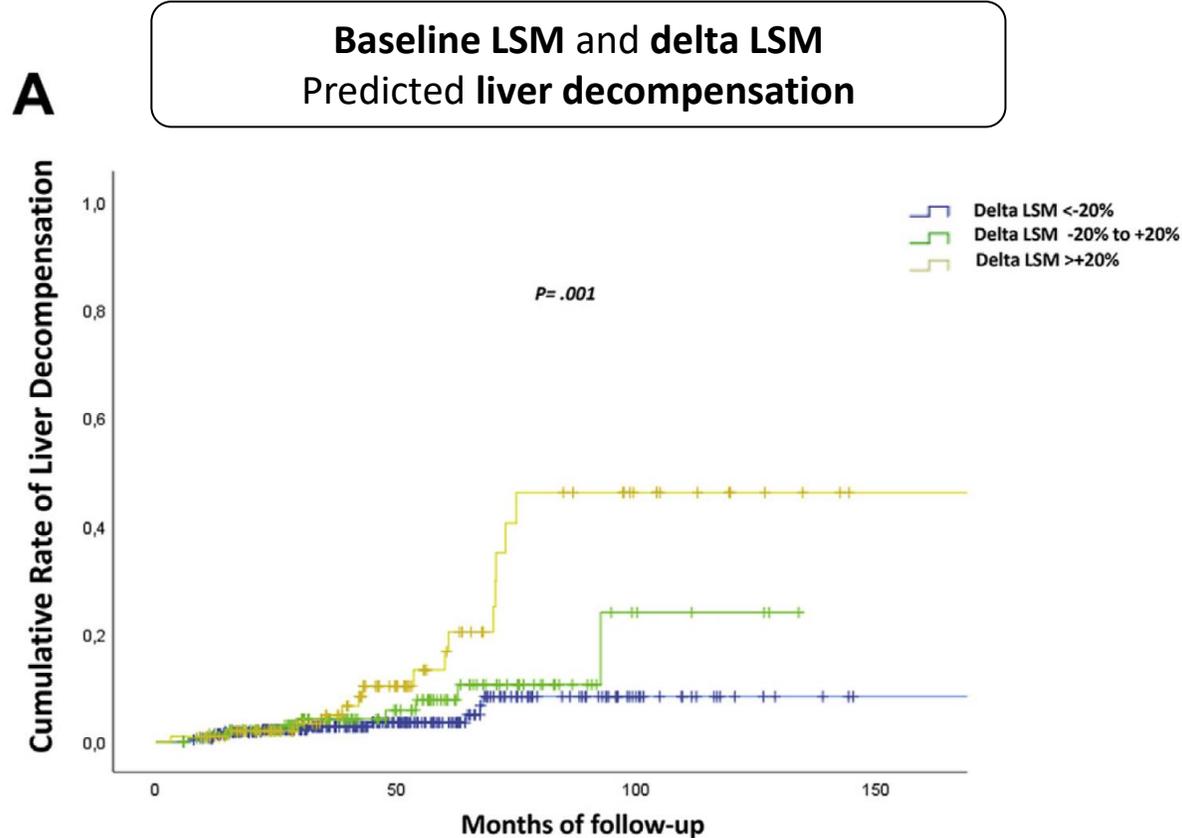

10 920 patients with MASLD and repeated VCTE (median interval: 15 months [11.3-27.7])

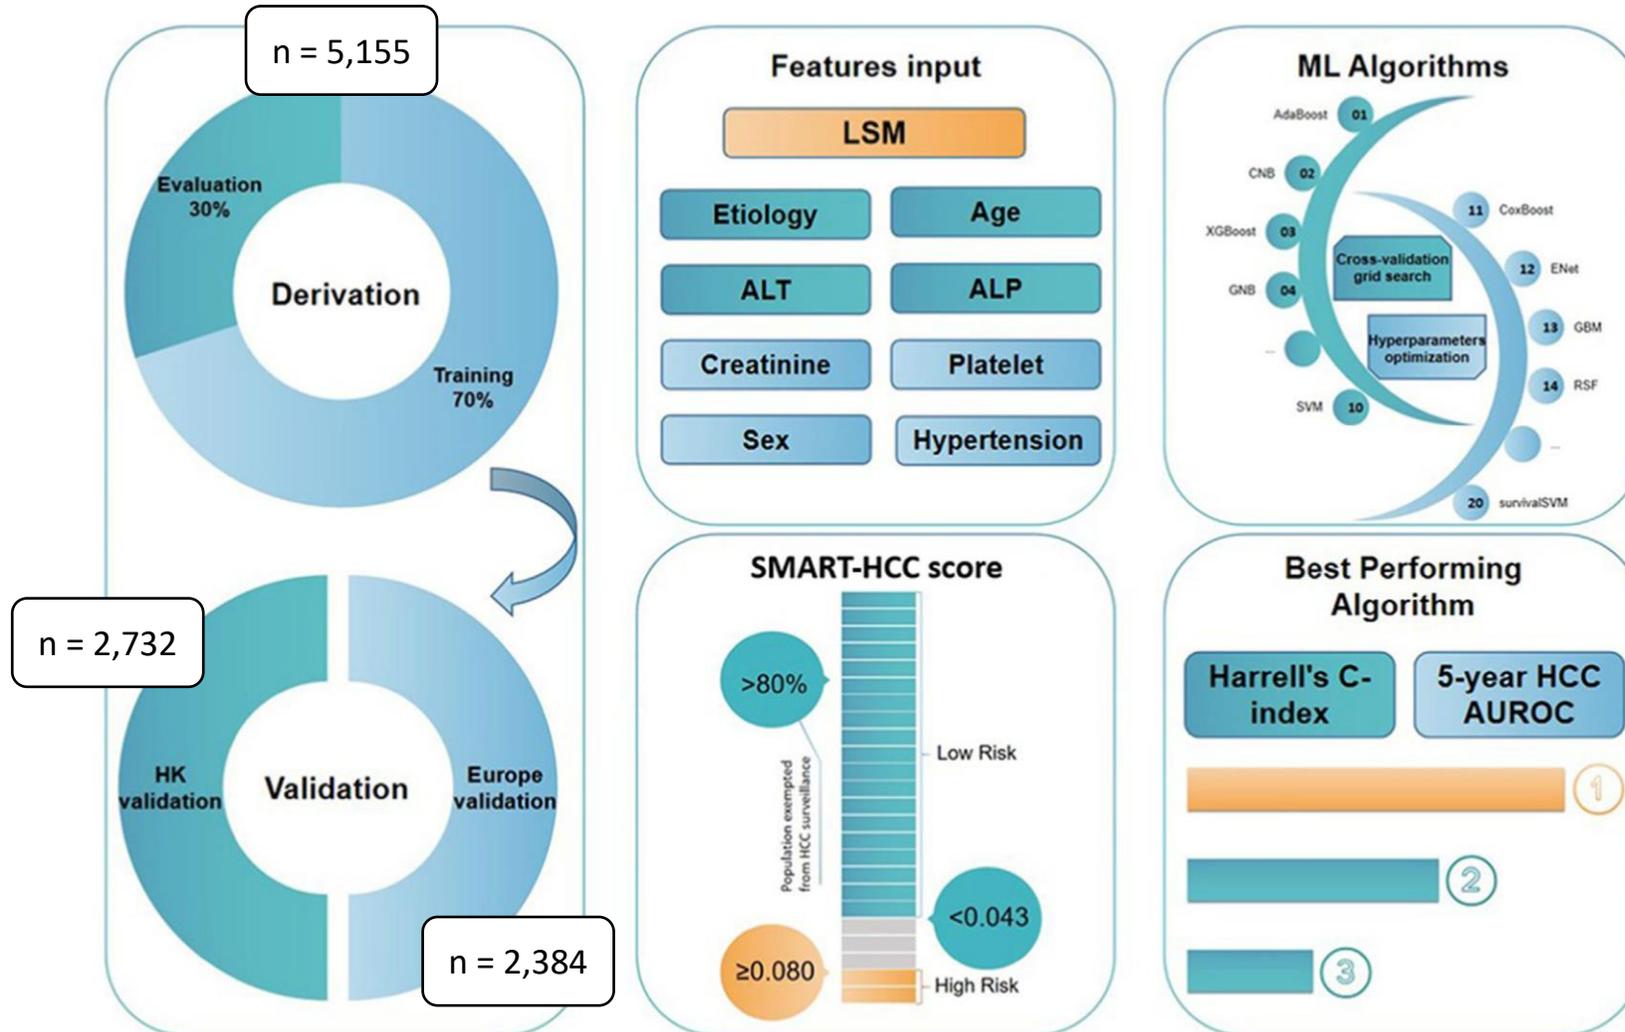

# Monitoring disease progression with elastography

## Multicentric international cohort

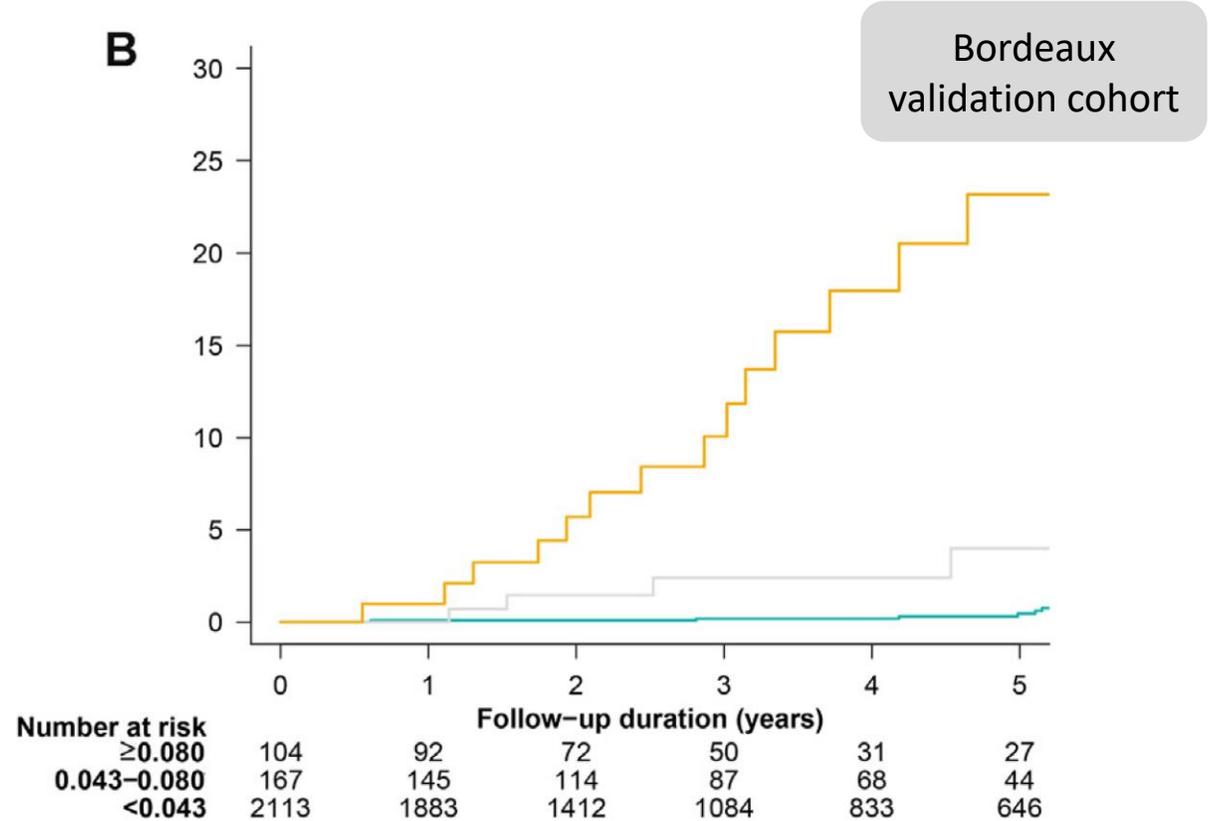

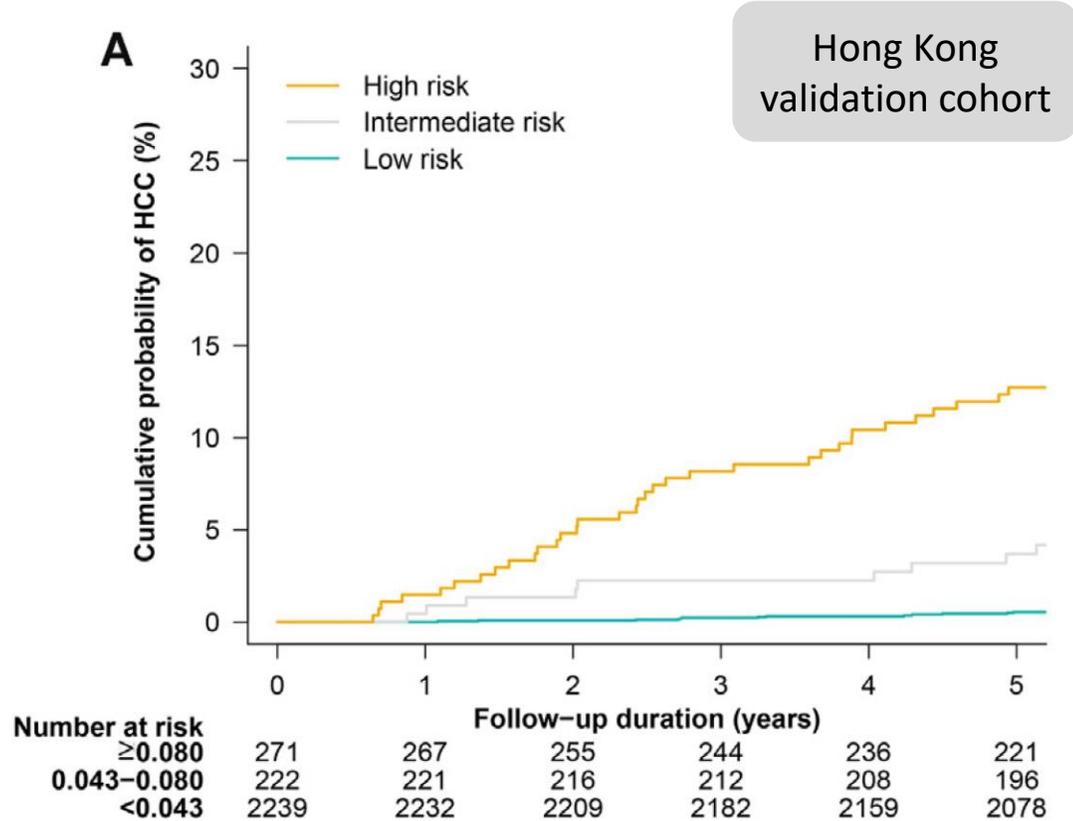

533 patients with MASLD, cALCD (VCTE >10 kPa or F3-4 at histology), and repeated VCTE within 1 year  
Median follow-up : 37 months

# Risk equation for HCC prediction

# Risk equation for HCC prediction

Significant better discrimination compared to aMAP score and Toronto HCC risk Index  
 No significant difference by subgroups (etiology, age, sex, T2DM, hypertension)

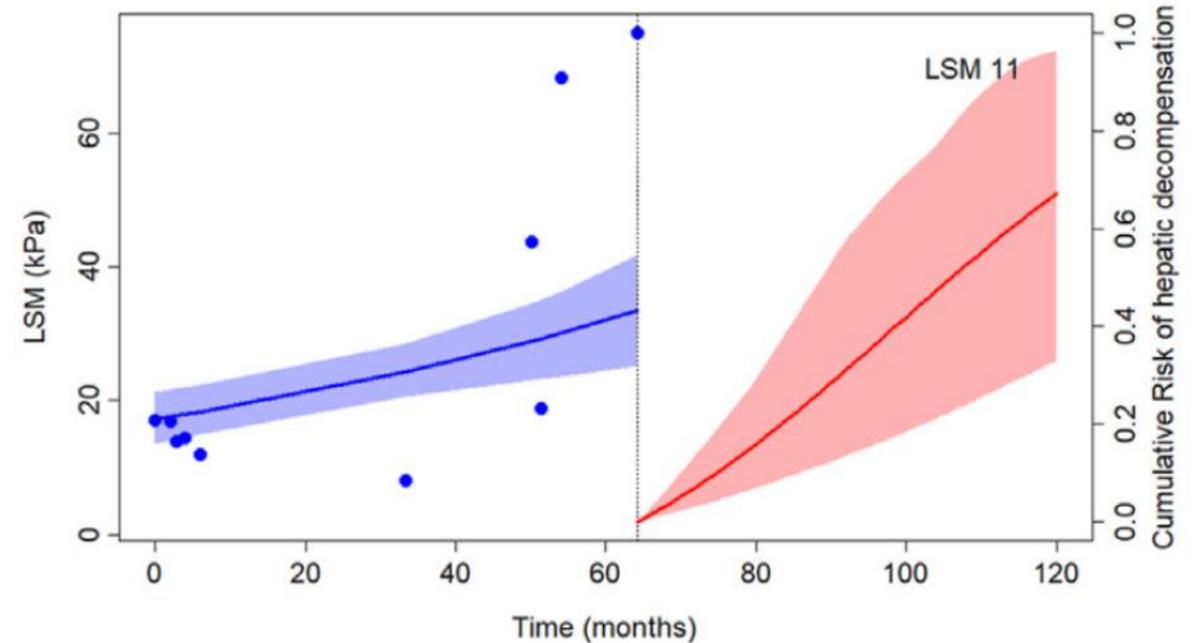

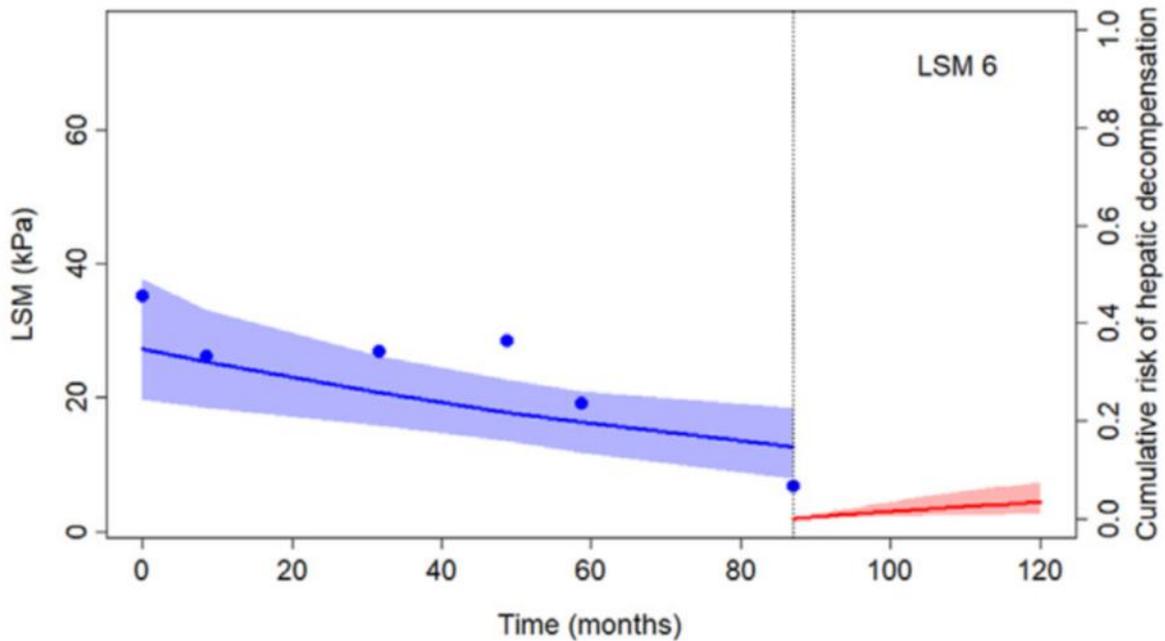

# Modelling the dynamics for a better prediction

## Single center study (Vienna)

720 patients with chronic liver disease, LSM  $\geq 10$  kPa, and  $\geq 2$  VCTE (total: 2673 VCTE)

Median follow-up : 71 months (62 events of decompensation)

Joint modeling of liver stiffness measurements dynamics

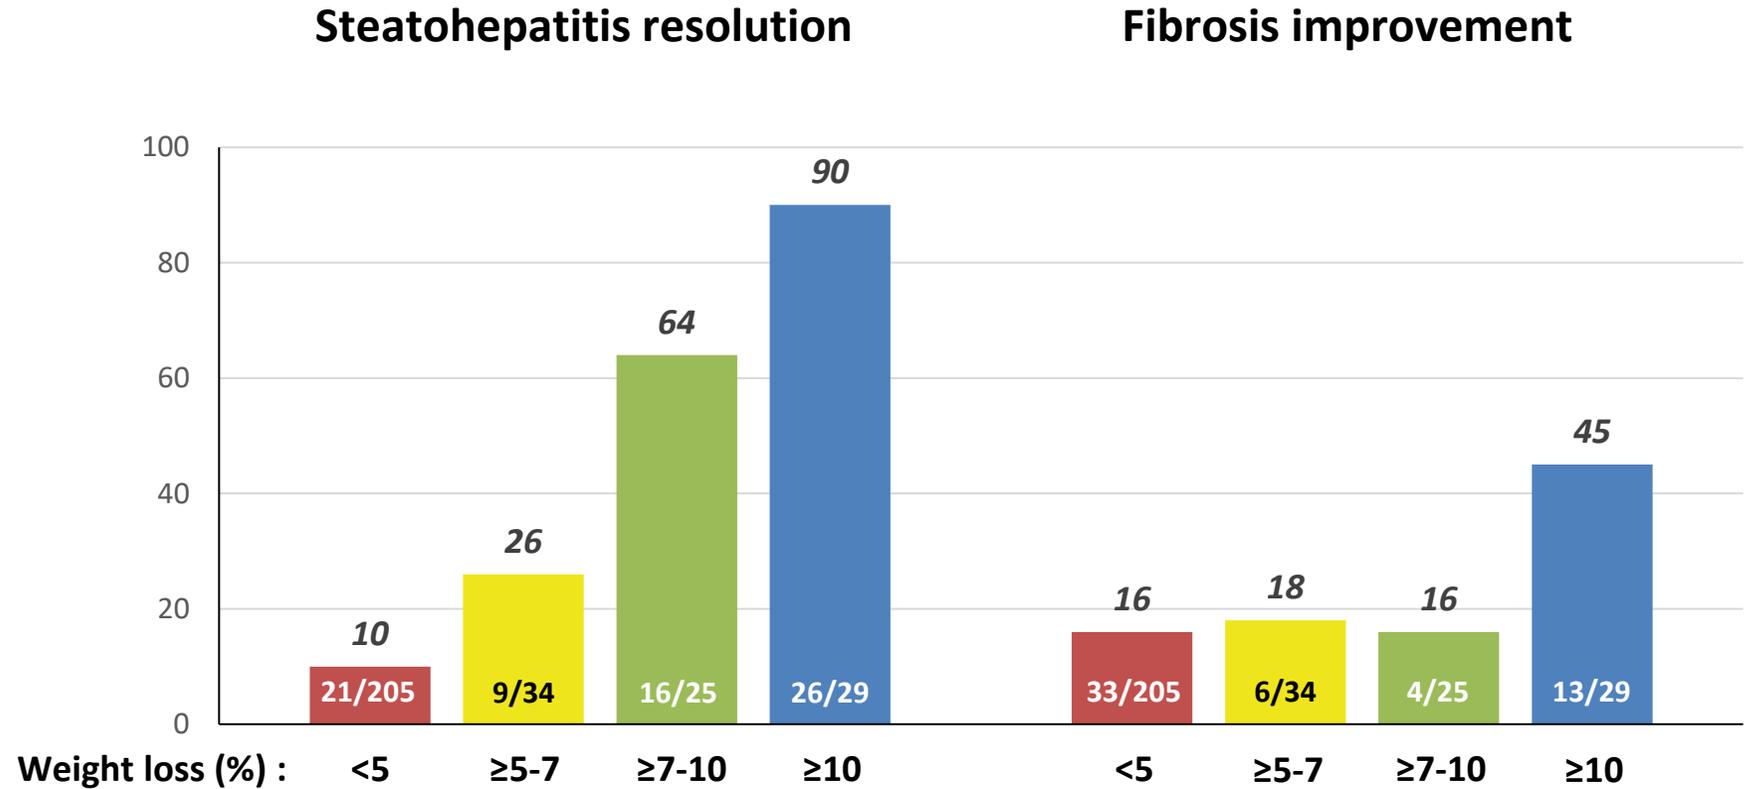

## 2. Monitoring treatment response

# Weight loss and improvement in histology

293 patients with NASH

52 weeks hypocaloric diet + exercise

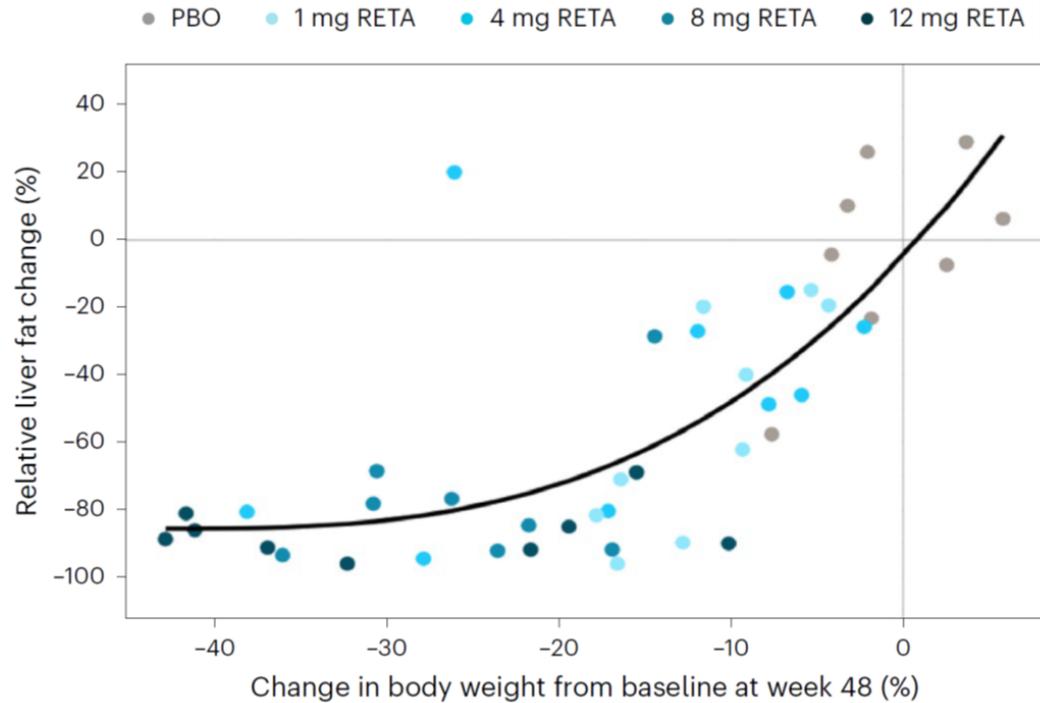

Paired liver biopsy

# Weight loss and improvement in histology

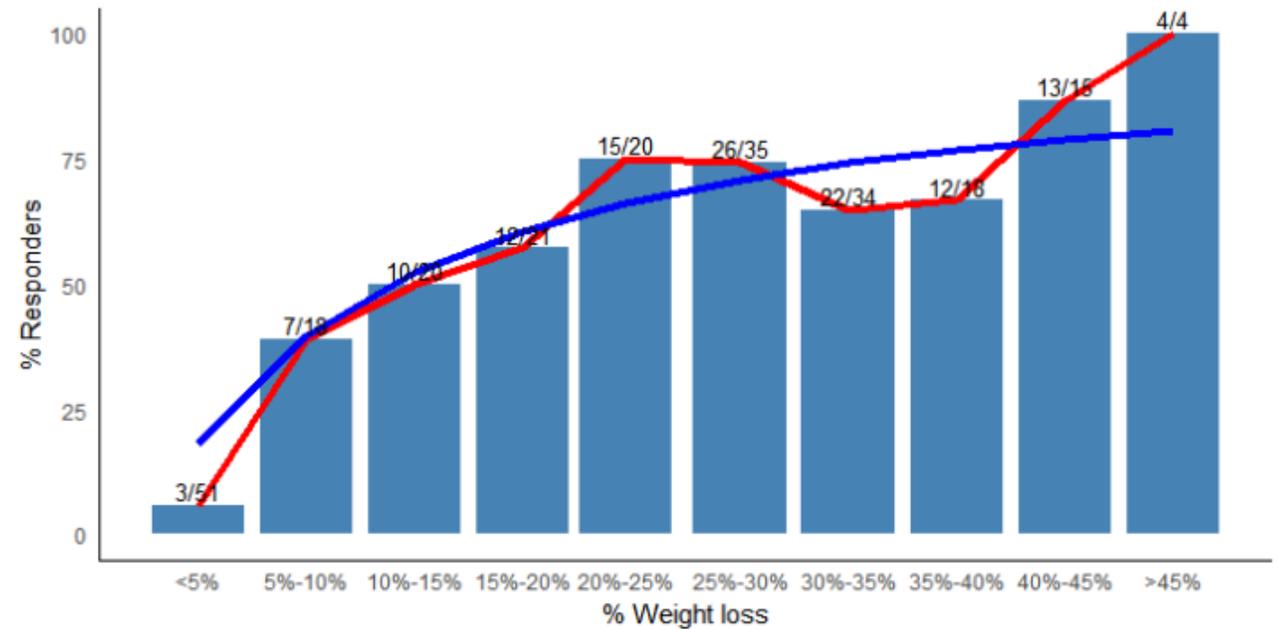

## Phase 2 Retatritude trial

Outcome : liver fat evolution (MRI PDFF)

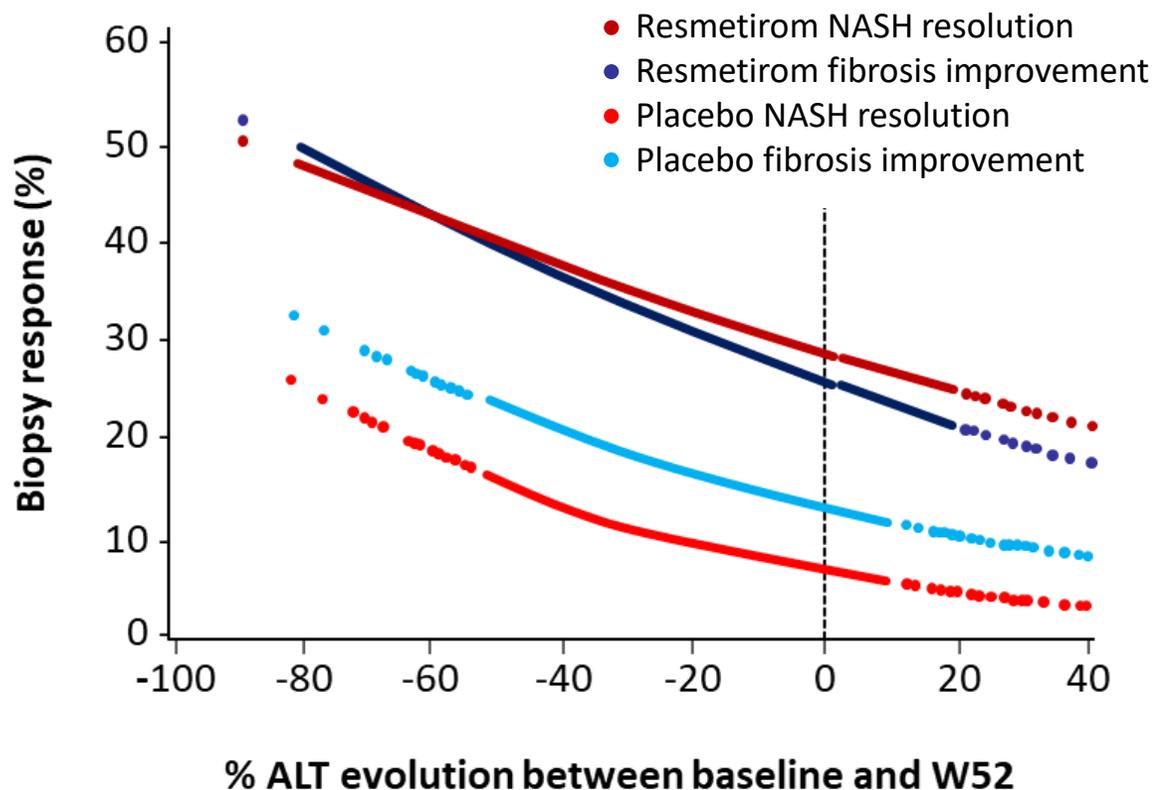

## BRAVES study

Outcome : NASH resolution without worsening of liver fibrosis

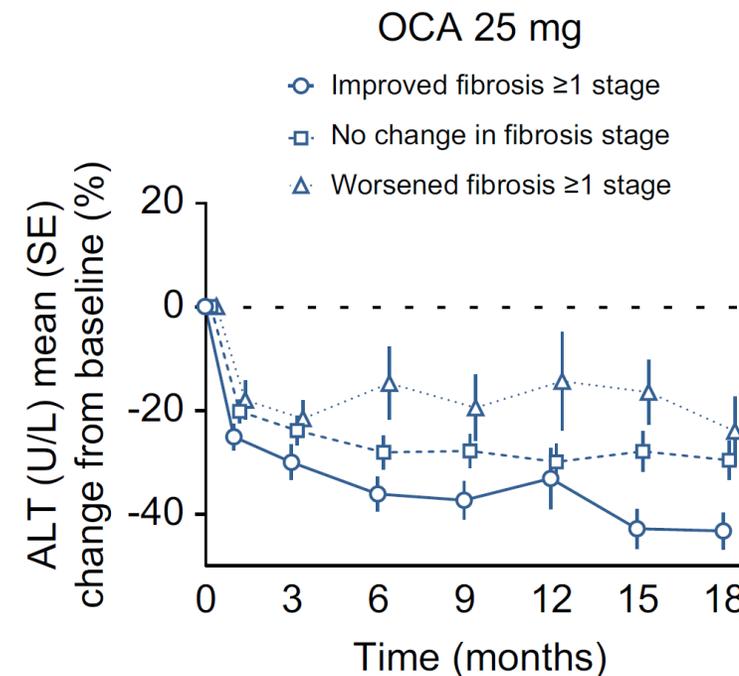

# Monitoring treatment response with serum transaminases

## Phase 3 MAESTRO

## Phase 3 REGENERATE

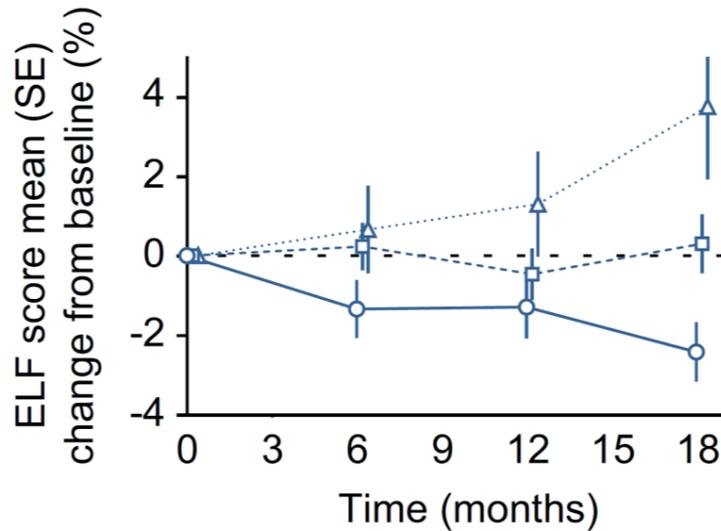

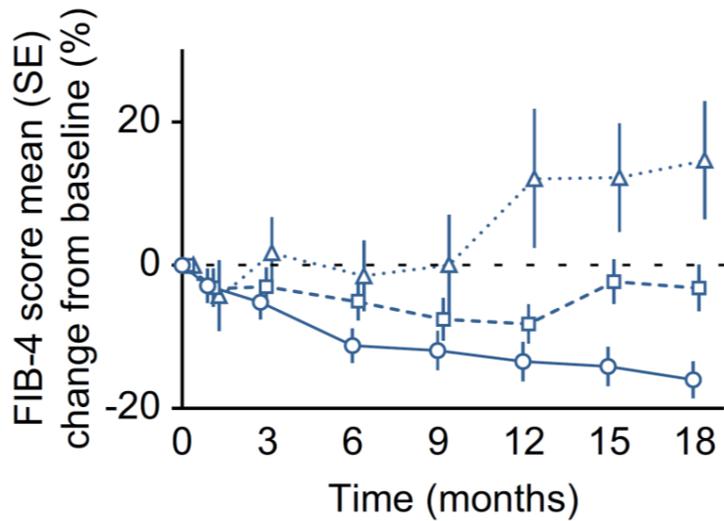

Improved, n =	92	92	92	92	91	92	90
No change, n =	124	124	124	123	123	121	119
Worsened, n =	34	34	34	34	34	33	31

# Treatment response and non-invasive tests of liver fibrosis

## Phase 3 REGENERATE – OCA 25 mg group

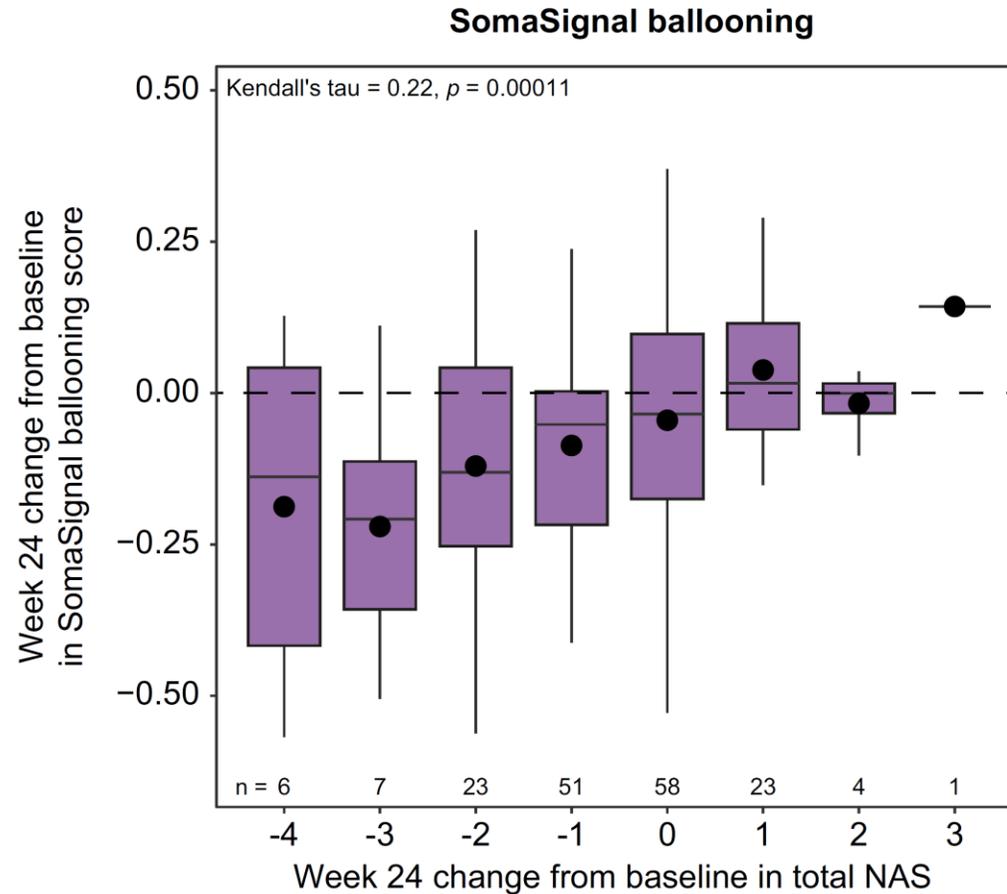

○ Improved fibrosis  $\geq 1$  stage   □ No change in fibrosis stage   △ Worsened fibrosis  $\geq 1$  stage

# Monitoring with a test dedicated to the diagnosis of ballooning

**Phase 2b FALCON1**

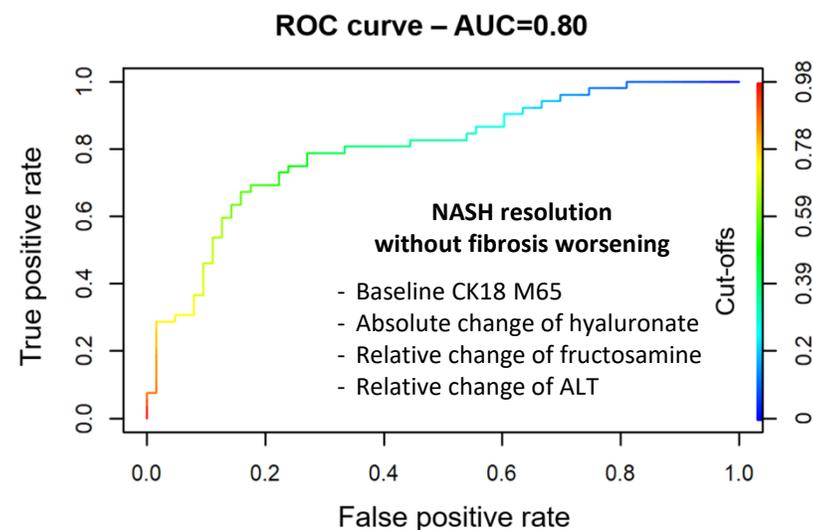

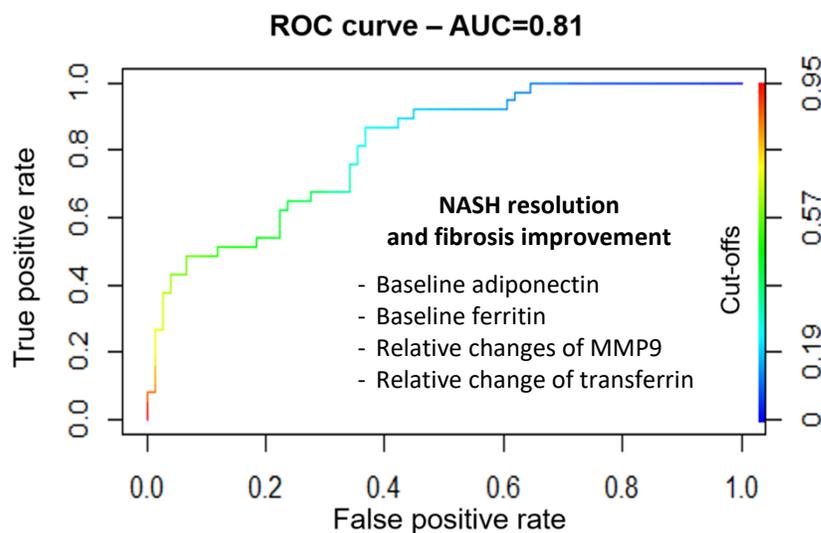

**Pegbelfermin in NASH + F3**

# Monitoring treatment response with a dedicated test

Phase 2 NATIVE trial - 142 patients treated 24 weeks with Lanifibranor 800 / 1200 mg

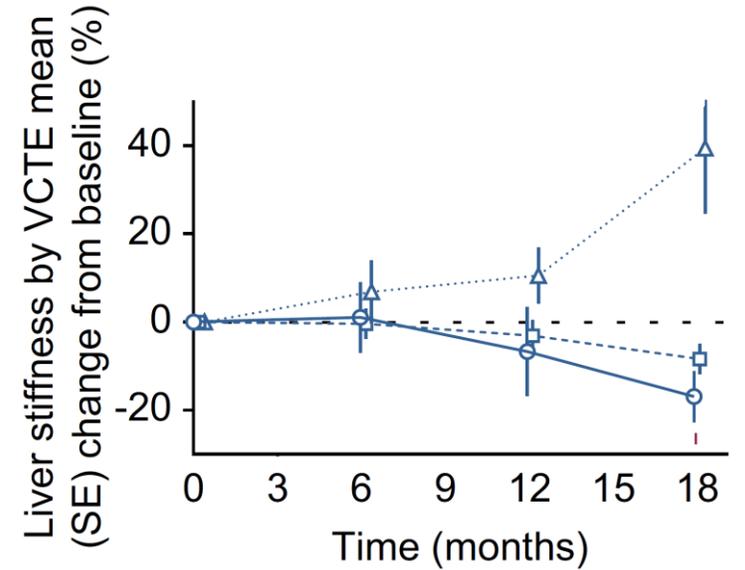

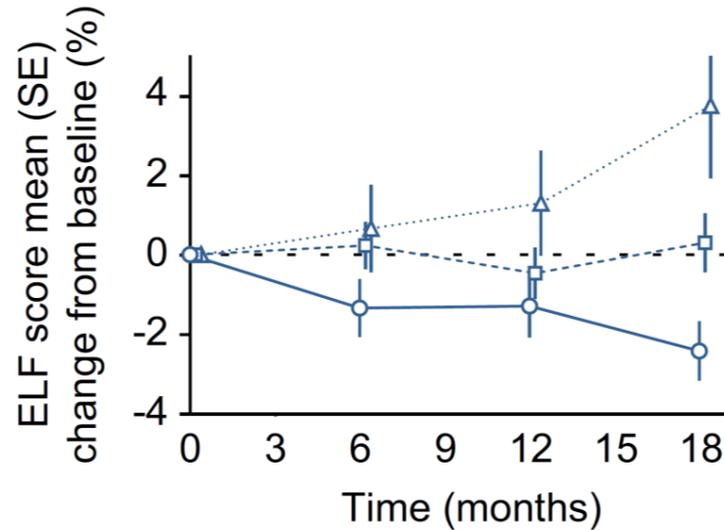

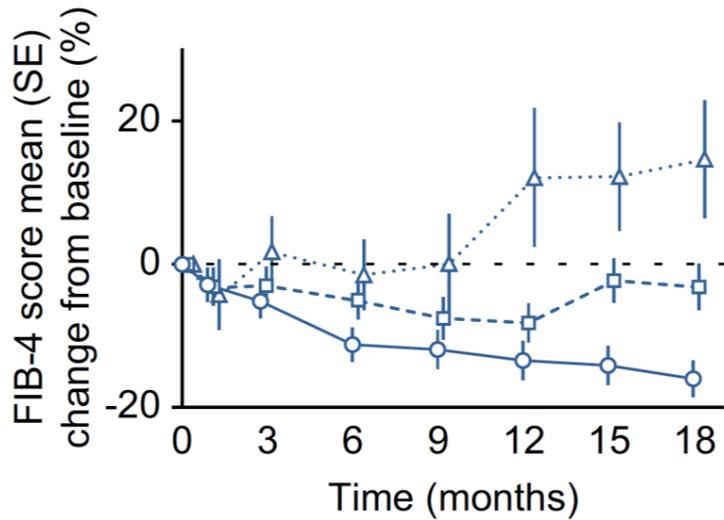

Scores	NASH resolution and fibrosis improvement		NASH resolution without fibrosis worsening	
	Biomarkers included in the model	AUROC	Biomarkers included in the model	AUROC
MACK-3	Baseline raw values + absolute change at EOT	0.76	Baseline raw values + absolute change at EOT	0.78
FIBC3	<i>None selected</i>	--	Absolute change at EOT	0.62
NFS	<i>None selected</i>	--	Absolute change at EOT	0.62
ELF	<i>None selected</i>	--	Baseline raw values + relative changes at EOT	0.68
FIB4	<i>None selected</i>	--	<i>None selected</i>	--
ABC3D	<i>None selected</i>	--	<i>None selected</i>	--

# Treatment response and non-invasive tests of liver fibrosis

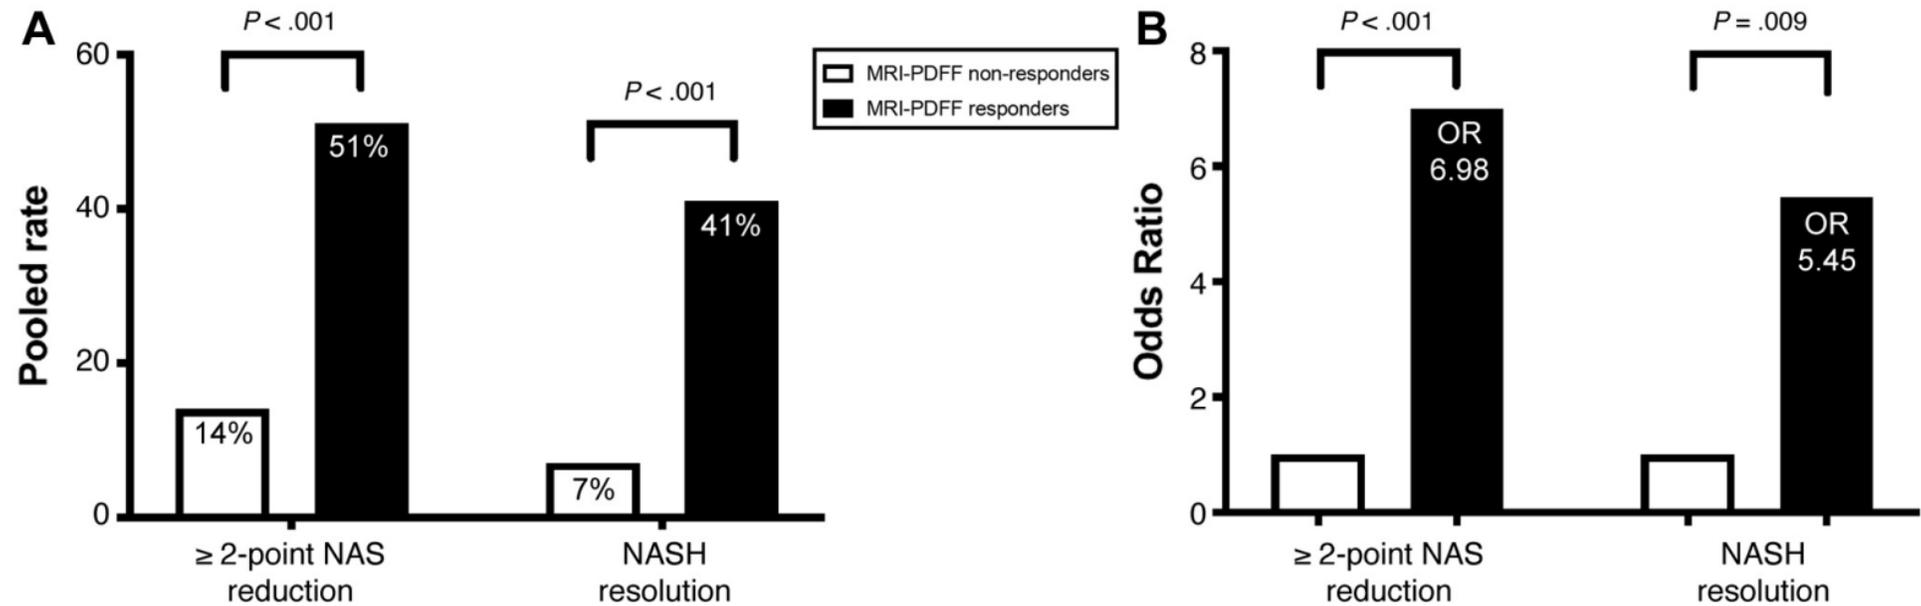

## Phase 3 REGENERATE – OCA 25 mg group

○ Improved fibrosis ≥1 stage   □ No change in fibrosis stage   △ Worsened fibrosis ≥1 stage

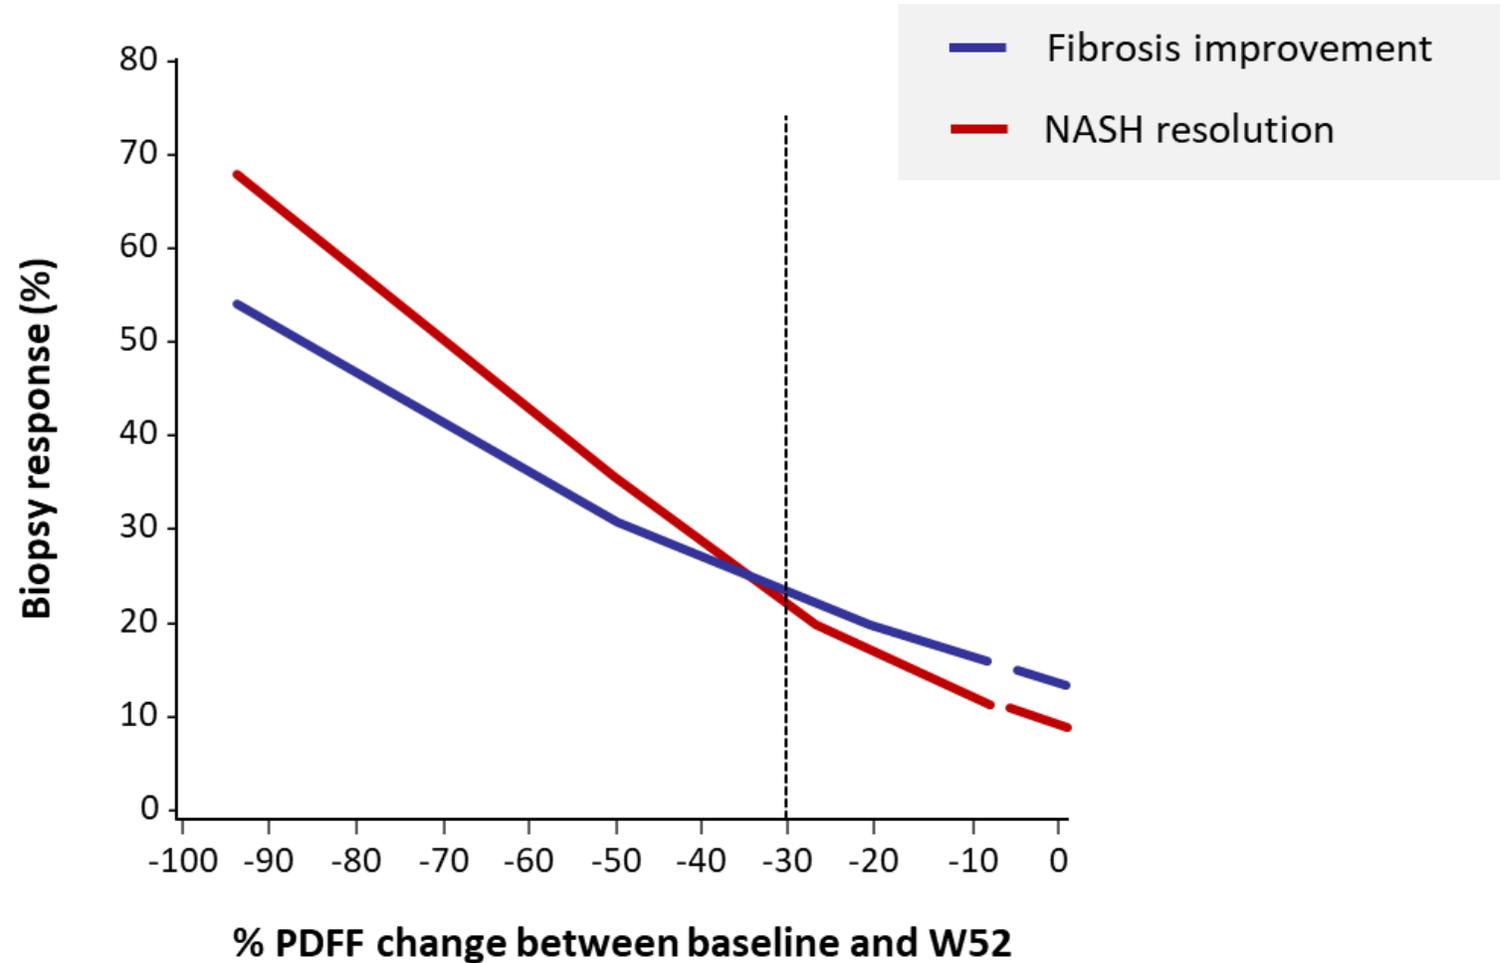

# Liver steatosis and treatment response

Outcome	Studies (patients)	<30% reduction in MRI PDFF	≥30% reduction in MRI PDFF	p	OR
≥2 points improvement in NAS	7 (346)	51%	14%	<0.001	6,98 (95% CI: 2.38-20.43)
NASH resolution	6 (318)	41%	7%	<0,001	5,45 (95% CI: 1.53-19.46)

# Liver steatosis and treatment response

## Phase 3 MAESTRO NASH (Resmetirom)

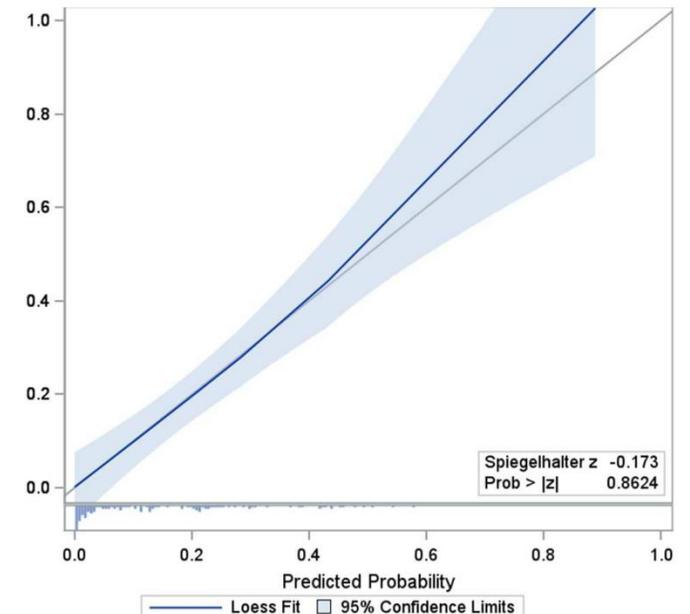

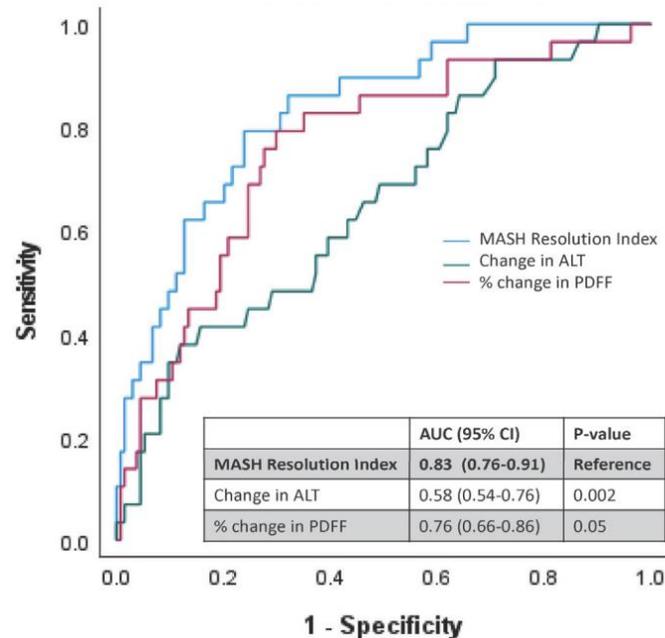

# Monitoring treatment response with a dedicated test

- Derivation cohort : 95 patients with MASLD from single center (San Diego)
- Validation cohort : 163 participants with MASH F2-3 from the ENLIVEN trial (FGF21 pegozafermin)

	MASH resolution index	
	Derivation cohort	Validation cohort
AUC	0.81, 95% CI 0.69 to 0.93	0.83, 95% CI 0.76 to 0.91
Cut-off	MASHResInd $\leq$ -2.67	MASHResInd $\leq$ -2.67
N	27	17
Sensitivity	88.9%	100.0%
Specificity	32.5%	12.7%
PPV	23.5%	19.9%
NPV	92.6%	100.0%
Grey zone, N (%)	50 (52.6%)	57 (35.0%)
Cut-off	MASHResInd $\geq$ -0.67	MASHResInd $\geq$ -0.67
N	18	89
Sensitivity	55.6%	89.7%
Specificity	89.6%	53.0%
PPV	55.6%	29.2%
NPV	89.6%	95.9%

AUC, area under the receiver operating curve; MASH, metabolic dysfunction-associated steatohepatitis; NPV, negative predictive value; PPV, positive predictive value.

**MASH resolution index :**  
baseline IRM PDFF, ALT, AST + percentage change in MRI PDFF, ALT

# Assessment of safety and treatment response on resmetirom (expert panel recommendations)

\* ALT improvement should be accompanied by improvement in imaging ( $\geq$ 30% reduction in MRI-PDFF)

# Conclusion

- In untreated MASLD patients, the risk of liver-related complication can be monitored by repeating non-invasive fibrosis tests during the follow-up.
- The field of treatment response monitoring remains totally open.
  - ✓ There are a lot of candidates, and ongoing phase 3 trials will help to evaluate them (histological, clinical endpoints).
  - ✓ Monitoring steatosis appears a promising approach for metabolic drug,
- An ideal biomarker of treatment response should perform regardless of the drug's mechanisms, which remains an unmet Grail.
